

QA Lab

Are tests were a mix of both broad and specific questions, trying to keep it even throughout.

With the specific tests, we were able to infer the minute details and functionality of the website. Testing specific cases does not lend itself to necessarily a common use mindset, where taking analytics into account would be beneficial.

With the broad tests, we were able to get the general overall feel of how the website works. A con with the broad test is that if there is an error, it will be more difficult to pin the source of the error.
